EXPERIENCE

Creovia

SaaS company creating modern tools for educators.

Lead Front-End Developer

September 2023 - Current

- Collaborated with CEO and product stakeholders to evaluate feature proposals, scope technical feasibility, and drive product decisions, independently architecting and shipping applications within a platform serving 30,000+ students
- Designed and led development of a DocuSign-style document signature application supporting multi-signer workflows and classroom-based distribution, integrated with the company's existing data platform
- Built a staff performance evaluation system used to conduct 20,000+ evaluations, coordinating with backend engineers to define API contracts and data requirements
- Led and mentored a team of 3 front-end developers through code reviews and pair-programming, ramping junior engineers to independent contributors

Front-End Developer

May 2023 - September 2023

- Re-architected the codebase from a monolithic structure into modular components, improving readability and scalability, including a full migration from JavaScript to TypeScript
- Optimized rendering performance through in-depth code refactoring, reducing render times from 3 seconds to sub-second, directly improving user experience across the platform

PROJECTS

Phoenix Comedy Underground | React, TypeScript, tRPC, PostgreSQL, Square API

2025 – 2026

Full-stack ticketing and marketing platform for a live comedy venue

- Built a production ticketing platform with Square payment processing, webhook-driven order lifecycle, and a self-service refund portal with token-based security
- Implemented custom analytics pipeline tracking visitor sessions, UTM attribution, and conversion funnels across the purchase flow to inform marketing strategy
- Designed type-safe architecture using tRPC + Drizzle ORM + Zod validation with idempotent webhook handling for payment and email events

LingApp | React, Go, Python, PostgreSQL, Docker | GitHub | Live Demo

2025

AI-powered conversational language learning platform with real-time pronunciation feedback

- Designed three-tier microservice architecture separating React frontend, Go REST API, and Python ML service across 16k+ lines of code with Docker Compose orchestration
- Architected event-driven audio pipeline processing WebM recordings through 5-stage workflow: S3 upload, presigned URL generation, parallel transcription, phoneme alignment, and async stats aggregation
- Deployed self-hosted ML inference stack running 4 models locally (Whisper, IPA-Whisper, Gruut, Chatterbox TTS) eliminating external API dependencies for privacy-preserving speech analysis
- Built speech analysis pipeline evaluating pronunciation at the phoneme level with beam search decoding and confusion matrix tracking across 40+ English phonemes
- Implemented real-time conversational practice with audio recording, GPT-4o response generation, and AI voice synthesis enabling natural dialogue flow with instant pronunciation scoring
- Shipped complete platform features: OAuth authentication (Google/GitHub), threaded conversations, Stripe subscription tiers, and pronunciation dashboard with category-based phoneme visualization

EDUCATION

University of Maryland

B.A. Philosophy, Linguistics

College Park, Maryland

May 2021

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, Go, Java, Ruby, HTML5, CSS3, SQL

Frameworks: React, Next.js, tRPC, Express (Node.js), Rails, Drizzle ORM, Jest, Vitest

Developer Tools: Linux, Vim, Git, Docker, pnpm, Webpack, PostgreSQL, MongoDB, Redis, AWS S3
